**TITLE OF RESEARCH :**

**A study on adequacy of access of road traffic accidents victims requiring ambulance services to trauma centres by development of geographical information system in government hospital in Klang Valley.**

<p>Overview</p>	<p>Trauma due to road traffic accidents causes deaths and disability and have implications on socioeconomic as well as organisations. The first 60 minutes after an injury is considered as a 'golden hour' when trauma care is most effective in saving lives. A loss of injured person who is potentially saveable, due to delay in his or her transport, insufficient evaluation or treatment, is a tragic event. The objective of this study is to determine the adequacy of access of road traffic accidents patients requiring ambulance services to trauma centres in government hospital in Klang Valley. It is a cross-sectional study whereby all trauma patients requiring ambulance services will be the study population. It is hoped that this study will provide a best method by using Geographical Simulation Model that can be used by health care professionals to transfer trauma patients to an appropriate level of care in shortest possible time frame and in the best possible condition.</p>
